A computer is a machine that can be instructed to carry out sequences of arithmetic or logical operations automatically via computer programming. Modern computers have the ability to follow generalized sets of operations, called programs. These programs enable computers to perform an extremely wide range of tasks.

If you have access to the physical internals of the computer, i.e. if you can open the case, and if you are willing to go through the trouble, you might find some date labels on some components (like the hard drive). I've used this method several times successfully, but it depends on where the computer was bought (small company, big vendor like Dell, internet, ...) and if they have a habit of ...

tl;dr: power states in your computer are controlled by an implementation of ACPI (advanced configuration and power interface). At the end of a shutdown process, your operating system sets an ACPI command indicating that the computer should reboot. In response, the motherboard resets all components using their respective reset commands or lines, and then follows the bootstrap process.

First: The term monad is a bit vacuous if you are not a mathematician. An alternative term is computation builder which is a bit more descriptive of what they are actually useful for.. You ask for practical examples: Example 1: List comprehension:  $[x*2 \mid x \in [1..10], \text{ odd } x]$  This expression returns the doubles of all odd numbers in the range from 1 to 10.

As is the case with any verb tense in English, it is generally possible to give short answers to a question. This is certainly the case for questions in the past tense.. If the question commences with one of the traditional question words such as WHO, WHERE, WHEN, WHY, WHAT, WHICH or HOW, it requires a more detailed answer and it is not possible to give a short answer.
