Fortran 77 And Numerical Methods

The best benchmark remains your own application. I assume you have profiled it and know where it spends its time, and have optimised it where possible; running it will at least ensure that the machine, operating system, and compiler exist, a factor often overlooked amidst a profusion of numbers and promises.

A recurrence equation (also called a difference equation) is the discrete analog of a differential equation. A difference equation involves an integer function $f(n)$ in a form like $f(n)-f(n-1)=g(n)$, (1) where g is some integer function. The above equation is the discrete analog of the first-order ordinary differential equation $f'(x)=g(x)$.
